Services Areas

Secure Software Development

Denim Group builds and integrates secure enterprise software applications where security and trust are requirements. Offerings include:

- Secure .NET and Java
- Enterprise Web Applications
- Service Oriented Architecture
- Portal Integration
- Web Services
- Microsoft SharePoint
- Trusted Quality Assurance
- Application Remediation
- Load & Performance Testing

Application Security

Denim Group security consultants are trained and experienced developers with knowledge of the software development lifecycle and secure development strategies to develop, assess and remediate application source code.

- Assessments & Penetration Testing
- Security Code Reviews
- 3rd Party Product Review
- Remediation
- Training
- Mentorship Program

Application Security – A Growing Concern

For the better part of the last decade, information security professionals have been locking down enterprise computing environments by securing infrastructure components - firewalls, routers, servers and operating systems. An entirely new set of security challenges has arisen with the demand for putting customer information online, many times via in-house developed applications and databases.

Application-level security is a growing area of focus in both the application development and information security fields. Moving beyond the infrastructure focus of traditional information security practices, application-level security involves auditing the code and databases used in custom-developed applications. Denim Group works to develop secure applications throughout the Software Development Lifecycle.

Why Denim Group?

A Strategic Approach to Building Secure Software

Denim Group's Secure Development methodology addresses security at various stages in the software development life cycle, as opposed to the traditional approach of scanning or attacking completed code to review the application's security state. Denim Group addresses the organization-wide issues of software security using a risk-based approach and OWASP's Application Security Maturity Model.

Application Security Consultants are also Practicing Developers

Denim Group does not have separate development and security teams - they are one and the same. Our developers' working knowledge of the threats and countermeasures encountered in the application security practice, as well as development strategies that fit into the software development lifecycle, provide the level of expertise needed to develop, assess and remediate application source code.

A Trusted Workforce

Each member of the Denim Group team is an employee and not a contractor. Having a tight core team allows us to invest in training and certifications, resulting in unparalleled performance and consistency of execution. Additionally, every employee of Denim Group undergoes thorough background checks that cover criminal, lawsuit, and credit history. A large percentage of these employees are also ex-military and many have held the highest government clearances available.

Strong Strategic Relationships with Leading Application Security Vendors

Through strategic relationships with leading software companies, Denim Group customers have access to industry-leading scanning and protection software. Because of the long-standing nature of the relationships with key vendors, Denim Group actively influences the product features and regularly helps improve the fidelity of the scanners.

Thought Leaders in Secure Development Practices

Denim Group's Principals and key team members are contributors to the application security community on a national level and are regular presenters at national and regional industry conferences. Information on upcoming presentations can be found at www.denimgroup.com. A Denim Group-maintained security blog cultivates an open dialogue within the community at <http://blog.denimgroup.com>.
